

Evgenii Zakharov

Senior Frontend Engineer · React, TypeScript, Architecture & Performance

to@risen.dev • +37455433551 • Remote worldwide (contractor or EOR), Yerevan (UTC+4) •

<https://github.com/risenxxx> • <https://linkedin.com/in/risenx>

PROFESSIONAL SUMMARY

Senior Frontend Engineer, 8 years building product interfaces end-to-end in React and TypeScript: design systems and component libraries, SSR at 7.5M monthly active users, and real-time interfaces whose state arrives over a socket and has to stay smooth on a phone. Original author of nestjs-zod, the standard way to use Zod with NestJS, at 5.5M downloads per month.

Spec-driven by default: I write the specification, the constraints and the failing test cases before implementation starts — including when an AI agent does most of the typing — and hold edge cases, accessibility and performance budgets as release gates rather than follow-ups. Five production products across five domains were built this way.

Work where a product meets its own seams: BFF layers and typed contracts between front and back, experiments wired into cached SSR flows, product analytics feeding the decisions, and the rendering and main-thread budgets that decide whether an interface feels right.

WORK EXPERIENCE

X5 Group • Remote • 04/2024 – Present

One of Europe's largest food retail groups

Senior Software Engineer, Frontend

- Engineered SSR-heavy Next.js flows for a UGC recipe platform serving 7.5M monthly active users, improving Lighthouse Performance on key mobile pages by 15-25 points and stabilizing render and hydration paths.
- Reduced shipped JS payload by 20-35% through code splitting, dependency optimization and tree-shaking, cutting long main-thread tasks and improving TBT on key pages.
- Launched A/B testing (Varioqub) into SSR flows, partitioning cache keys by experiment bucket to preserve consistent per-user variant delivery without giving up caching.
- Improved API contracts and mapping validation, reducing data-mapping Sentry issues by 70% and raising frontend/backend contract reliability through stricter runtime checks.
- Automated internal React CMS interfaces used daily by over 100 editors and moderators, aligning UI behavior with the content lifecycle and removing manual handoffs from the publishing path.
- Embedded unit, integration and contract tests into CI ahead of release, cutting regression escapes before they reached production.

Gift Fight • Remote • 2025

Telegram-based gaming product, launched to production with around 1,500 players

Platform & Full Stack Engineer

- Built the player-facing Telegram Mini App in React 18 and TypeScript — around 13k lines on a feature-sliced structure — covering the whole flow from inventory and betting to round replay and payouts.
- Kept the interface in step with a live game loop: round state arrives over Socket.IO with reconnect handling, and p95 state-sync latency held at 120 ms in load tests with 300 concurrent sessions.
- Owned the product end to end behind that interface: TypeScript services on Hono, PostgreSQL with Drizzle, Redis and NATS, and Temporal workflows keeping multi-step rounds deterministic under partial failures.
- Shipped and ran it myself: Kubernetes on Hetzner described in Pulumi with GitOps delivery, releases and rollbacks under 3 minutes, and Cloudflare in front for edge security and rate limiting.
- Animated the game loop with Motion and Lottie — betting timer, round transitions, win reveal — inside the Telegram WebView on phones, and wired TON Connect and Telegram Stars payments into the same flow.
- Instrumented the product for decisions: self-hosted Rybbit for user actions, conversion and funnels, and an event pipeline delivering into ClickHouse with Metabase dashboards on top.
- Used those numbers to decide: after launch the funnel showed free channels bringing non-paying users, and the product was closed on the data rather than carried on.

Sigma Games • Remote • 2023 – 2025 • <https://github.com/sigma-gaming>

iGaming platform, sole engineer across frontend, backend and infrastructure

Platform & Full Stack Engineer

- Shipped four frontend applications on one platform — the player-facing Telegram Mini App and the operator admin panel in React 18 and TypeScript, an Astro authentication app and a grammy bot — sharing a component layer and an Effector state model.
- Designed the game surfaces themselves: bet flows, round animation and result reveal, live balance updates pushed over SignalR, and an admin panel where operators edit players, promotions and payouts.
- Backed them with the platform: 10 ASP.NET Core services on .NET 9 over a 27-entity PostgreSQL schema with EF Core, integration-tested against real PostgreSQL, Redis and NATS.
- Provisioned infrastructure as code with Pulumi across GCP, DigitalOcean and Cloudflare, delivered through FluxCD onto a Talos Kubernetes cluster.

SberEducation • Remote • 09/2022 – 03/2024

EdTech division of Sber, a major European tech company

Senior Software Engineer, Frontend

- Mentored mid-level engineers through code review and pairing, and drove team-wide frontend standards for API contracts, accessibility and testing to raise overall engineering quality.
- Built BFF endpoints aggregating multiple upstream services into stable client contracts, adding versioning and runtime validation to prevent breaking changes from reaching clients.
- Introduced schema-driven client generation (Hasura, GraphQL) in CI, generating TypeScript types and enforcing schema checks to shift integration failures left.
- Migrated an accessibility-first payment widget and reuse-first UI primitives, reaching Lighthouse Accessibility 95+ and standardizing keyboard and focus behavior across monetization paths.
- Delivered Telegram-integrated web apps under strict navigation and session constraints, improving Lighthouse Performance on core mobile WebView flows by 10–20 points.
- Integrated SSO and delivered core platform modules for a multi-tenant B2B marketplace launch, focusing on security boundaries and staged rollout.
- Contributed backend message processing with NestJS and Prisma, keeping server behavior aligned with frontend contracts.

Haiku Dev • Saint Petersburg • 10/2021 – 09/2022**Senior Software Engineer, Frontend**

- Set and documented a shared CSS-in-JS UI kit and design primitives adopted by 4 product teams, running code reviews that cut duplicate implementations and visual drift.
- Implemented URL-synced catalog filters and an Effector GraphQL wrapper, standardizing query and state flow and removing duplicate fetch logic across pages.
- Reworked a cross-browser modal library including Safari, with focus trap, scroll lock and stacking rules to prevent UI breakage across environments.
- Prototyped a micro-frontend with Webpack Module Federation, validating remote ownership, shared-dependency strategy and independent release workflows.

Freelance • Remote • 03/2018 – 09/2021 • <https://www.upwork.com>**Full Stack Engineer**

- Delivered projects end-to-end with direct client ownership over scope, deadlines, deployment and post-launch support.
- Automated a hotel-management CRM with a room-by-date booking grid and drag-to-create and drag-to-move reservations, kept responsive through virtualized rendering and a normalized client-side cache.
- Implemented server-validated conflict detection for overlapping reservations, partial-day turnovers and per-booking services, so two administrators editing the same day could not corrupt a booking.
- Integrated fiscal receipt printing end-to-end across payment, receipt issuance and printer hardware, with retries and reconciliation so no payment was recorded without a receipt and no receipt without a payment.

PROJECTS

Frame Player

07/2026 - Present • <https://github.com/risenxxx/frame-player>

Video player for Windows and macOS on Tauri 2 and libmpv (Svelte + TypeScript): a canvas overlay walked frame by frame with raw pixel buffers for frame-accurate stepping, subtitle timing corrected for fps drift between 23.976 and 25, 4K HDR cast to televisions without re-encoding, and torrent streaming during download. Written largely by AI agents against requirements and acceptance cases I defined and verified.

Tuned

2026 - Present

AI resume tailoring (React 19, TanStack Router and Query, Tailwind v4): the live PDF preview renders the same react-pdf component inside a Web Worker and rasterises it with pdf.js, the editor has its own drag-and-drop engine, and every variant is a patch over one base document rather than a copy.

@cardbox/editor

05/2021 - 10/2021 • <https://github.com/cardbox/editor>

Slate-based WYSIWYG editor, shipped as a published library (ESM/CJS/UMD with type declarations).

Registry-driven architecture for actions, keybindings, decorations and per-element settings; feature modules for lists, links, headings and code with a Prism-backed decoration pass. Sole engineer on it.

nestjs-zod

05/2022 - 10/2024 • <https://github.com/BenLorantfy/nestjs-zod>

The standard way to use Zod with NestJS, at 5.5M downloads per month, where one schema serves validation, TypeScript types and generated OpenAPI docs. Transferred to another maintainer in 2024.

SKILLS

Languages: English (full professional proficiency), Russian

Programming Languages: C# (.NET), JavaScript, Rust, SQL, TypeScript

Backend: API design, BFF, Fastify, GraphQL, Hasura, Hono, Microservices, NestJS, Node.js, REST, Socket.IO, uWebSockets.js, WebSockets, Bun, JWT, OAuth

Frontend: Bundle and Runtime Profiling, Caching, Core Web Vitals, Next.js, React, SSR, User Experience, Tailwind, Vite, ESLint, Prettier, Motion (Framer Motion), Lottie, Canvas 2D, requestAnimationFrame, Web Workers, Virtualized rendering, Drag-and-drop, Telegram Mini Apps, WebView performance, Feature-Sliced Design, Design systems, Accessibility (WCAG), Svelte, Astro, Radix UI, TanStack Query, pdf.js, Effector, HTML, CSS, Redux

Data: ClickHouse, Dragonfly, Drizzle, NATS, PostgreSQL, Prisma, Redis, Temporal, Metabase

Platform: AWS, Cloudflare, Cloud Infrastructure, Docker, FluxCD, GCP, GitOps, Hetzner, IaC, Kubernetes, Pulumi

Practices: AI-assisted development (Claude Code, Copilot), CI/CD, Code Review, Distributed Systems, Fault Tolerance, High Availability, Mentoring, Multi-tenant SaaS, Observability, Scalability, SLOs, System Architecture, Technical Design, Technical Documentation, unit/integration/contract testing, A/B testing, Vitest, Cypress, Project scoping

Analytics: Rybbit, Funnels and conversion analytics

EDUCATION

Studies in Computer Engineering

South Ural State University (SUSU)
